- **Code review sessions**
Schedule dedicated time for peer code reviews to improve code quality and share knowledge. This practice will help catch issues early and promote best practices across the team
- **Automated testing**
Begin implementing unit tests and integration tests for critical features to catch bugs early and improve code reliability.
- **Sprint planning poker**
Use estimation techniques like planning poker to improve our task estimation accuracy and reach team consensus on effort required.

- **Multitasking across multiple user stories**
Stop working on multiple user stories simultaneously. Focus on completing one story before moving to the next to improve flow and reduce context switching.
- **Waiting for perfect solutions**
•Stop over-engineering solutions or waiting for the perfect approach. Embrace iterative development and continuous improvement.

- **Strong team collaboration**
Continue the excellent collaboration . The team showed great willingness to help each other and share knowledge throughout the sprint.
- **Meeting sprint commitments**
Continue delivering on our sprint commitments. We completed all 11 user stories as planned, which demonstrates our ability to plan and execute effectively.
- **Clear task breakdown**
Continue breaking down user stories into manageable tasks. The task decomposition in this sprint was well-structured and helped track progress effectively.
